

Network Security Guardians Staying Ahead of Attackers to Protect the Digital Realm

In today's **rapidly evolving world**, Paolo, a network security administrator, strives to keep his organization secure so that it can continue to scale and thrive.

Unfortunately, this is **no easy task** due to the latest trends that have impacted network security.

Paolo and his team have noticed a **significant increase** in the amount of traffic flowing in and out of their network.

This is largely due to the company's adoption of **hybrid work**...

The increase in **devices** connecting to their network...

And the mass adoption of the **cloud** and **SaaS** applications.

This shift has **created immense pressure** on Paolo and his team.

They are now more vulnerable with a larger attack surface and must add more security tools to their already complex security stack.

To make matters worse, Paolo and his team have another threat **lingering** in the shadows.

An illustration showing a pair of hands in red sleeves typing on a laptop. The laptop screen displays lines of code. Surrounding the laptop are various tech items: a USB drive, a power adapter, a set of keys, and a power cord. The background is a dark red with a faint world map.

Threat actors today now have easy access to highly sophisticated tools and resources.

This includes the use of red team tools, which make attacks more evasive...

An illustration of three hooded figures, representing hackers, sitting at their respective computer workstations. They have angry expressions on their faces. The background is a dark red with a faint world map.

Hacking-for-hire groups, which makes them more widespread...

And most importantly, **artificial intelligence**, which amplifies the **scale, speed, and sophistication** of today's attacks.

With AI, attackers can...

Move at lightning speed...

Reach more targets with ease...

Launch more new and
never-before-seen threats.

Unfortunately, Paolo's current security tools are no match for AI-enabled attackers...

Paolo and his team solely rely on **static signature databases**, which are often too slow and outdated.

Attackers are extremely evasive...

The use of AI, red team tools, and more allow them to easily evade security scanners.

Now, Paolo and his team are struggling to protect their network against attackers, while also trying to manage their large and complex security stack...

Enter Palo Alto Networks

Cloud-Delivered Security Services...

Powered by

Precision AI™

Palo Alto Networks Precision AI™ harnesses the strengths of machine learning, deep learning, and generative AI, and applies it to rich and diverse threat data for accurate and real-time protection against today's most advanced threats.

Precision AI™

Machine Learning

Generative AI

Deep Learning

With Precision AI powering Palo Alto Networks Cloud-Delivered Security Services, Paolo and his team can **detect and prevent new and never-before-seen threats** in real time and with extreme accuracy...

Especially those created by AI...

These services **analyze** all network traffic in **real time**, instead of solely relying on signature databases.

They use security models that continuously train on data for faster and more accurate detection.

That phishing link?

BLOCKED

That file loaded with ransomware?

DENIED

The hacker trying to gain access through a security camera?

THWARTED

And they're all natively integrated in a **single network security platform** that's easy to manage.

Now with Palo Alto Networks on their side, Paolo and his team can always stay ahead of attackers and be prepared for whatever comes next.
